Profile

Health data analyst with eight years of experience turning clinical and operational data into reliable decisions. Builds reproducible pipelines, works closely with clinicians, and explains uncertainty plainly. Experienced with privacy-sensitive records, service evaluation, and multidisciplinary delivery.

Experience

Senior Health Data Analyst · Harbour Health Network · 2022–present

- Led reporting for 18 community clinics and three hospital outreach teams, combining appointment, referral, and outcome data into a consistent monthly view.
- Rebuilt patient-flow dashboards in SQL and Python; reduced manual reconciliation from two days to three hours per reporting cycle.
- Partnered with nurses and service managers to define measures before implementation, then documented limitations and data-quality checks alongside each measure.
- Introduced versioned validation rules for missing dates, duplicate referrals, and inconsistent service codes. The team resolved 1,200 historical exceptions without suppressing unresolved records.
- Coached four analysts on peer review, accessible chart design, and safe handling of person-level data.

Health Informatics Analyst · Southern Community Care · 2019–2022

- Evaluated a telehealth pilot across six regional services using matched operational extracts and a documented analysis plan.
- Automated weekly extracts and quality reports for a registry of 85,000 records; improved completeness of priority fields from 88% to 97%.
- Presented findings to clinical leads with clear denominators, confidence intervals, and caveats, helping them decide where follow-up appointments were needed.
- Worked with privacy and security teams to replace emailed spreadsheets with role-based access to approved dashboards.

Data Analyst · Civic Research Cooperative · 2017–2019

- Built repeatable R notebooks for public-health surveys and published methods notes so colleagues could reproduce the calculations.
- Cleaned linked survey and service data, preserving source values and recording every transformation for audit.
- Prepared plain-language summaries for policy staff while keeping the underlying statistical detail available for review.

Selected work

Emergency demand forecasting

Created a transparent weekly forecast using admissions, seasonality, and public-holiday effects. Compared it with a simple baseline and reported where forecast error was highest. The model helped teams plan staffing discussions but was never presented as a clinical decision tool.

Equity in appointment access

Mapped wait times by region and service type, checked small-cell disclosure risk, and worked with community representatives to interpret differences. The final dashboard showed both absolute counts and rates so small populations were not misread.

Additional contributions

Service-measure design and review

- Facilitated workshops with clinicians, analysts, and operational leads to define referral and follow-up measures that could be reproduced from approved source data. Published a concise dictionary with calculation rules, exclusions, and known limitations.
- Set up peer review for dashboard queries. Each change included a comparison with the previous release, a sample of record-level checks, and a short note for people who used the report.
- Worked with information-governance colleagues to test small-cell handling and access permissions before sharing new views. Escalated ambiguous cases instead of making silent data exclusions.

Training and communication

- Designed a two-session introduction to cohort definitions and data-quality checks for service staff. Participants practised tracing a displayed figure back to its source fields and discussing what would change the interpretation.
- Wrote methods notes for a telehealth evaluation and a regional access review. Both notes separated observed differences from causal claims and identified which questions required further evidence.
- Presented an accessible chart review to analysts and managers, using examples of axes, denominators, and annotations that had previously confused readers.

Selected presentations

Making patient-flow measures reproducible, internal health analytics forum, 2025.
Reading regional access measures with care, community-service evaluation meeting, 2023.

Skills

Analysis: SQL, Python, R, reproducible notebooks, cohort definitions, descriptive statistics, service evaluation.
Delivery: stakeholder workshops, data dictionaries, code review, accessible dashboards, technical writing.
Governance: privacy-aware reporting, access controls, quality assurance, change logs.

Education

Master of Public Health, University of Newcastle, 2017.
Bachelor of Science (Statistics), University of Wollongong, 2014.

Professional development

Health data governance workshop, 2024 · Applied data visualisation course, 2023 · First aid and cultural safety training, 2022.
